Description

1. **Public Transportation** (a highly specialised sector with a high complexity and large combination of products, based on over 10 years technical development). Competition on the full range of products is very thin in Europe and non-existent in Greece. Competition on part-solutions is more frequent. These products include Public Transport Routing and Scheduling, Programming, Planning, Costing, Reporting, Event handling, Task Assignments, Record keeping, Bus Equipment monitoring, Communications, Passenger Information, Passenger Displays, Voice announcements, Disable and Blind passengers handling, Fare Evasion Control, etc.
2. **Ambulance Dispatch Center** (also a highly specialised sector with a high complexity and large combination of products, based on over 4 years technical development). Competition on the full range of products is wider in Europe while in Greece there are 2 competitors. These products include Dispatching, Monitoring, Hospital Information, Event Handling, Communications, etc.
3. **General Transport Logistics** (a less specialised sector with a large number of competitors of varying quality). This is a web-based application including Fleet management, Routing and Scheduling, Proof of Delivery, Event handling, Reporting, etc.
